16 Futuristic STEM Jobs: Finding a Career in the Future

By: Vince | May 24, 2018 11:50 AM

[Tweet](#)[Share](#)[Share 124](#)

No matter how hard you try to predict the future, it will always be uncertain. While some probably thought we would have had flying cars by now, it's not quite the case.

Most science fiction though, for the most part, eventually becomes science fact.

So how do we take that knowledge and prepare our children for future?

Well, if we follow trends and look to research, we can do a pretty good job of predicting advancements. Flying cars were probably a stretch of a guess, but driverless cars? Sure. And wouldn't you know it, you're seeing more of them being tested on the road every single day.

Technology is at the forefront of such innovations. So for parents looking to give their children a leg up in the future, that means [introducing STEM in early childhood](#) to help kids develop related tech skills and future-proof their education.

I mean, consider the employment landscape of 1990. Jobs like Social Media Manager and UX Designer were unheard of—in fact, many jobs didn't exist even ten years ago. It's also reported that [65% of children entering school will eventually work at jobs that don't exist today](#).

So for this post, we're setting our crystal ball to the year 2030. And while we can't tell you if there will be flying cars, we can give you a glimpse of what the job market might look like.

1. Automated & Robot System Repair

In the future, due to efficiency and costs, services like fast food ordering, obtaining a driver's license, picking up a prescription, or [even getting dental surgery or your teeth cleaned](#), will be performed at a kiosk or at an automated service location—you will rarely interact with a human provider.

The systems that run these automated POS (Point of Sale) kiosks and service experiences will need to be maintained, though. Enter a human automated system technician or robot repair person who can replace parts, fix lines of code, and test the machine before it goes back online.

2. Green Power Creator

Harnessing sustainable sources of energy isn't just wishful thinking—we must turn to alternate forms of energy to support our growing needs as a global population. Solar. Wind. Water. These virtually untapped resources of power are waiting to be wrangled.

The energy industry is ripe for disruption—something that's already happening with electric and solar and replacing, dirty fuels like coal and gas. Wind and water power are next to be exploited, but there are still other untapped [energy sources like plankton](#).

The future will need people to find these new resources—and engineers to develop, test, deploy, and repair these systems.

3. Technology Tutor & Trainer

Technology is evolving as fast as it is created. The way we're learning will evolve, too. Now and into the future, we'll be best served to be always learning and challenging ourselves.

Imagine a tomorrow where you log into your work station in the morning, check in with your manager, and after a few hours of work, you spend the next hour in a virtual learning session with a tech tutor. She's getting you up to speed on a new technology that connects your company's systems to a virtual platform so you can interact with your customers in a virtual world.

The future is a world where independent contractors and consultants thrive because they're experts in their fields, and hands-on, real experience is held in the highest regard, especially in education.

Learning online, in mobile apps, and via other non-traditional platforms is already happening—in the future, it will be the primary way we learn. Much like how Twitch streamers and Instagram personas are online stars now, tutors and tech trainers will take the spotlight in the future.

4. Drone Technician

The drone industry is still very much in its infancy. You could equate it to the motion picture industry around the time when silent films became talkies. In the future, drones will expand far beyond what they are today, and will be used for everything imaginable: From repairing telecommunication lines to delivering your Amazon Fresh order.

The maintenance of drones (and possibly some flight control) will still be done by humans, while engineers will continue to modify and update the flying bots.

5. Space Exploration

The Sci-fi series, *The Expanse*, paints a realistic portrait of what it might be like when we finally travel into space with the ease we take an airplane flight to another city. In the future, space tourism - and the industry around getting things into space - will be booming.

We'll need to build spacecrafts and space stations. Specialized dietary and exercise experts will also be needed to help humans battle the harsh environment of space. Materials specialists, space explorers, and engineers will all be working together to help us conquer the challenges of the universe beyond.

As our global population reaches epic proportions, we should be more focused on one thing: How to feed the world. [Vertical farming](#) is one solution, but with a goal of using no soil and 95% less water, it's going to be an uphill climb. Vertical farms certainly make sense in urban areas where space is more of an issue.

[Genetic seed engineers](#) will develop drought and disease-tolerant grow strains that maximize yield and quality. We'll also (don't be alarmed folks, we've [done it with chicken for years](#)) breed better food, no doubt using technology—and in general create all sorts of new food experiences.

7. 3D Printing Engineers

There is no telling how many different ways 3D printing will change the world, as it is already revolutionizing the creative and fabrication industries, medical applications, home construction, and the food industry. Those amazing applications will need to be developed; the 3D printers operated, maintained, and monitored.

8. Data Managers

These gatekeeper positions are held by people who have extensive backgrounds in digital security, data handling, and cryptology. Data managers will organize the now massive amounts of data that clutter our virtual clouds, while securing data, and when needed, destroying data.

9. Senior Wellness Managers

As we live longer, retirement and hospice care will be more in demand. Mental health, fitness, and other aging consultants will find opportunities in the senior health care field.

10. Streamcasters

In the future, television will be replaced with internet broadcast channel streams and digitally-born personalities. All content will be hyper-personalized, and producers will work with advertisers to cultivate content, news, information, and entertainment to a person's own unique interests. Customization and personalization will be handled by computers, but human hosts and commentators will still attract human audiences.

11. Biotech Engineers

From using cells to create human body parts and repair nerves, to using nanomedicine to heal wounds—there's a new breed of medicine on the horizon, and specialists in these treatment areas will be in high demand. Need to add a nano memory drive to your organic brain for more storage? Lucky you, biotech engineers do that too.

12. Science Ethicist/Technology Advocates

The future is a bold new world. Scientific advances in cloning and robotics don't have us asking the question of "can we," but rather, "should we?" When it comes to Biotech, robots, autonomous cars, smart holograms, and other amazing tech, we need people who understand both science and society, a key skill required of those want to fill future jobs, and can help develop laws and guidelines regarding how to proceed with the knowledge.

13. Chronocurrency Brokers

Digital currency like Bitcoin is one of the most sought after modern currencies. The next big currency trend? Well, it's built around the most valuable commodity humans have—time. [Time banking](#) is the forward thinking currency of the future and it's traded, bought, and sold on a virtual time market.

14. Digital Enforcers

In the future, specialized digital security contractors will monitor the internet for fraud or crime. They'll lock down accounts and pinpoint criminals with Orwellian preciseness. These independent agents will be combinations of white-hat hackers and security experts, and will be relied on to help with local and national law enforcement.

A.I. will need to learn how to act human. What better way than to introduce a robot to its new world? Just like a baby or toddler, an A.I. tech works closely with A.I. as it starts to assimilate and understand its new environment. Someone familiar with human behavior, social norms, and [how machine learning works](#) will be perfect for this occupation. That person should also be able to recognize the signals of when a robot or machine learning application isn't learning like it should.

16. Climate Analyst & Weather Moderators

Technology will evolve to help us effectively control the weather, and we will need specialized engineer-scientists to help monitor the weather patterns. They'll use technology like [cloud seeding](#) to fight drought and help reduce the effects of climate change.

How to Prepare for the Future

To recap, the best way to prepare your child for the future is to make sure they have a strong foundation in STEM and learn other adaptive skills.

Ayah Bdeir, the founder of [littleBits](#) says, "Give the kids inventions that are relevant to them as prompts, and then they start inventing to learn the underlying principles." It's [invention-based learning](#) and it can propel your child into the future: Teach kids the basics and build on them. Invent and re-iterate.

The idea is to go beyond the tech itself, and teach kids how something like computer programming can be used to create and innovate—and how it can change the world. iD Tech embraces that philosophy with project-based curriculum, top-notch instructors, and industry-standard tools.

In the end, technology is a vital component of the future. Unfortunately, many schools have yet to catch up, with only [one in four schools](#) teaching computer programming.

So whether you want your child to study virtual reality, [coding](#), [3D printing](#), [artificial intelligence](#), or any of the [dozens of courses](#) we offer, iD Tech can give your child the skills they need to fulfill the unique demands our technological future will bring.

ABOUT iD TECH

iD Tech is the #1 tech camp on the planet, and world leader in youth STEM education, with programs held online and at 75+ global locations offering 50+ innovative tech courses:

- Coding camps
- Video game camps
- Robotics classes & camps
- Creative arts classes & camps
- All STEM camps

We've bet our reputation on recruiting the top instructors in the country. Our small classes ensure customized learning, leading to "a-ha moments" and awesome outcomes. Programs include:

On-Campus Programs

Online Tutoring

All Coding Courses
